

## **Cerebellum Removed and CranioSacral Therapy**

**By: John Rollinson**

**Personal Information:** 5 year old girl

**History:** She had her left cerebellum removed at age 4 (14 months prior) due to a growth which was causing dangerous pressure inside the head. She was walking and talking, but had a very low threshold for temper tantrums, was easily over stimulated and highly sensitive to her surroundings.

**Previous Tx:** N/A

### **Evaluation:**

**Findings:** Her rhythm was stopped, the occiput - sacrum connection was very tense and contracted and the whole occiput area was in shock.

**Tools used:** We used cranial base release without the platform, unwinding of the neural cranium and dural tube decompression to allow a significant release of held tension and the rhythm to come on.

**Objective results:** Her interactions with others immediately became more harmonious.

**Subjective results:** She felt calmer.

**Length of sessions:** 45 minutes

**Number of sessions:** Ongoing
