

Barral Institute Case Study
Visceral Manipulation - Severe Reflux
Jennifer Neta, PT

Patient Age / Gender

2 years old

Patient Symptoms

Severe reflux.

Evaluation / Treatment

One treatment to cardiac sphincter; one release posterior line of tension on fundus of stomach and restored motility to esophagus/stomach - 15 minutes.

Outcome

Reflux stopped - previously was 20 times a day with limited nutritional intake. Reflux returned one month later; one time a day. Patient had one more session and completely went away.
